

Symmetric cohomology of groups as a Mackey functor

Constantin-Cosmin Todea

Department of Mathematics, Technical University of Cluj-Napoca, Str. G. Baritiu 25, Cluj-Napoca 400027, Romania

Abstract

Symmetric cohomology of groups, defined by M. Staic in [2], is similar to the way one defines the cyclic cohomology for algebras. We show that there is a well-defined restriction, conjugation and transfer map in symmetric cohomology, which form a Mackey functor under a restriction. Some new properties for the symmetric cohomology group using normalized cochains are also given.

Keywords: group, symmetric cohomology, transfer, restriction, conjugation

2000 MSC: 20J06, 18G60

1. Introduction

Symmetric cohomology for groups was introduced by M. Staic in [2] in order to associate to topological spaces some elements in the third symmetric cohomology of some groups. Further algebraic properties of symmetric cohomology of groups in low dimension were studied by the same author in [3]. M. Singh also studies symmetric continuous cohomology of topological groups in [1]. He shows that the symmetric continuous cohomology of a profinite group with coefficients in a discrete module is equal to the direct limit of the symmetric cohomology of finite groups. In Section 2 we continue the investigation of the first symmetric cohomology of a group and we propose a new approach for defining symmetric cohomology (with coefficients in a particular G -module, where G is a group) using normalized cochains, which seems to give some easier conditions to be verified. In Section 3 we prove the main result of this paper, Theorem 3.2 where we verify that the restriction, conjugation and transfer in symmetric cohomology satisfy the axioms of a Mackey functor. Some axioms are verified in general but for a few we need a restriction. If we can drop this restriction remains an open problem, which is proposed in Remark 1.1.

Email address: Constantin.Todea@math.utcluj.ro (Constantin-Cosmin Todea)

We believe that these results should be important for further developments in algebraic and topological context.

For the rest of this section we recall the definition of symmetric cohomology of groups, some notations and definitions for group cohomology. First we recall some well-known facts about ordinary group cohomology: restriction, transfer and conjugation map. We will give the explicit description of these maps using standard cochains from [4]. Let G be a group, let A be a G -module and $n \geq 0$ an integer. For G/H the set of left cosets of H in G , also denoted $G = \bigcup_{c \in G/H} c$, choose once and for all a representative $\bar{c} \in c$. By convention if $c = H$ we require $\bar{c} = 1$. If g_1, \dots, g_n are n elements from G we will use the notations

$$x_1 = g_1 \dots g_n, x_2 = g_2 \dots g_n, \dots, x_n = g_n.$$

Recall that the abelian group of n -cochains is $C^n(G, A) = \{\sigma : G^n \rightarrow A\}$ and we define the differential $\partial^n : C^n(G, A) \rightarrow C^{n+1}(G, A)$ by

$$\begin{aligned} \partial^n(\sigma)(g_1, \dots, g_{n+1}) = \\ g_1 \sigma(g_2, \dots, g_{n+1}) + \sum_{i=1}^n (-1)^i \sigma(g_1, \dots, g_i g_{i+1}, \dots, g_{n+1}) + (-1)^{n+1} \sigma(g_1, \dots, g_n). \end{aligned}$$

The homology of the cochain complex $(C^*(G, A), \partial^*)$ is called the cohomology of G with coefficients in A

$$H^n(G, A) := \text{Ker} \partial^n / \text{Im} \partial^{n-1}.$$

Let H be a subgroup of G and $g \in G$. Sometimes, when more groups are involved, for explicitness we will denote the differential with an index. For example $\partial_H, \partial_{^g H}$ are used for cohomology of the group H , respectively of the group $^g H$, where $^g H = gHg^{-1}$. By [4, Proposition 2.5.1] we have:

1.1. Restriction.

$$\text{res}_H^G : H^n(G, A) \rightarrow H^n(H, A), \quad \text{res}_H^G[\sigma] = [\text{res}_H^G(\sigma)],$$

where $\text{res}_H^G(\sigma)(h_1, \dots, h_n) = \sigma(h_1, \dots, h_n)$ for any $h_1, \dots, h_n \in H$ and $\sigma \in \text{Ker} \partial_G^n$.

1.2. Conjugation.

$$c_{g,H} : H^n(H, A) \rightarrow H^n(^g H, A), \quad c_{g,H}[\sigma] = [c_{g,H}(\sigma)],$$

where $c_{g,H}(\sigma)(^g h_1, \dots, ^g h_n) = g \sigma(h_1, \dots, h_n)$ for any $h_1, \dots, h_n \in H$ and $\sigma \in \text{Ker} \partial_H^n$.

1.3. Transfer.

$$\mathrm{tr}_H^G : H^n(H, A) \rightarrow H^n(G, A), \quad \mathrm{tr}_H^G[\sigma] = [\mathrm{tr}_H^G(\sigma)],$$

where

$$\mathrm{tr}_H^G(\sigma)(g_1, \dots, g_n) = \sum_{c \in G/H} \overline{x_1 c} \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \overline{x_2 c}^{-1} g_2 \overline{x_3 c}, \dots, \overline{x_n c}^{-1} g_n \overline{c})$$

for any $g_1, \dots, g_n \in G$ and $\sigma \in \mathrm{Ker} \partial_H^n$. Notice that $\overline{x_i c}^{-1} g_i \overline{x_{i+1} c} \in H$ and $\overline{x_n c}^{-1} g_n \overline{c} \in H$ for any $i \in \{1, \dots, n-1\}$.

In [2] M. Staic defines an action of Σ_{n+1} (the symmetric group on $n+1$ letters) on $C^n(G, A)$, using a generating set of transpositions $\{(1, 2); (2, 3); \dots; (n, n+1)\}$ by

1.4.

$$\begin{aligned} ((1, 2)\sigma)(g_1, \dots, g_n) &= -g_1 \sigma(g_1^{-1}, g_1 g_2, g_3, \dots, g_n), \\ ((i, i+1)\sigma)(g_1, \dots, g_n) &= -\sigma(g_1, \dots, g_{i-1} g_i, g_i^{-1}, g_i g_{i+1}, \dots, g_n) \quad \text{for } 1 < i < n, \\ ((n, n+1)\sigma)(g_1, \dots, g_n) &= -\sigma(g_1, g_2, \dots, g_{n-1} g_n, g_n^{-1}). \end{aligned}$$

Now [2, Proposition 5.1] assure us that formulas 1.4 give a well-defined action of Σ_{n+1} on $C^n(G, A)$ compatible with the differentials ∂ . Hence we have a new cohomology.

Definition 1.5. [2, Definition 5.2] The subcomplex of invariants denoted $CS^n(G, A) = C^n(G, A)^{\Sigma_{n+1}}$ is called the *symmetric cochain complex*. Its homology is the *symmetric cohomology* of G with coefficients in A and is denoted $HS^n(G, A) = ZS^n(G, A)/BS^n(G, A)$.

2. Some remarks on $HS^1(G, A)$ and $HS^2(G, A)$.

In [3] the author gives conditions for the natural map $HS^n(G, A) \rightarrow H^n(G, A)$ to be injective. For the first and the second symmetric cohomology these natural maps are injective in general. Similar results are obtained in [1] for (symmetric) continuous cohomology of topological groups, denoted $(HS_c^n(G, A)) H_c^n(G, A)$. We will show the easy detail, missed in both papers, that for the first symmetric cohomology group we actually have an equality.

Proposition 2.1. *With the above notations we have an equality $HS^1(G, A) = H^1(G, A)$. In particular, in the context of continuous symmetric topological groups ([1, Section 3]) we have $HS_c^1(G, A) = H_c^1(G, A)$.*

Proof. Recall the well-known fact $H^1(G, A) = \text{Der}(G, A) / \text{Pder}(G, A)$, where

$$\text{Der}(G, A) = \{\sigma : G \rightarrow A \mid \sigma(gh) = g\sigma(h) + \sigma(g)\},$$

$$\text{Pder}(G, A) = \{\sigma_a : G \rightarrow A \mid a \in A, \sigma_a(g) = ga - a\}$$

One can see, from Definition 1.5, that $\sigma \in \text{CS}^1(G, A)$ if and only if $\sigma(g) = -g\sigma(g^{-1})$. Therefor $\sigma \in \text{ZS}^1(G, A)$ if and only if $\sigma(gh) = g\sigma(h) + \sigma(g)$ and $\sigma(g) = -g\sigma(g^{-1})$. We will prove next that $\text{ZS}^1(G, A) = \text{Der}(G, A)$. The inclusion from left to right is trivial. Let $\sigma \in \text{Der}(G, A)$ and take $g = h = 1$ in the derivation relation to obtain $\sigma(1) = \sigma(1) + \sigma(1)$, thus $\sigma(1) = 0$. Now take $h = g^{-1}$ in the same derivation relation to get

$$\sigma(1) = g\sigma(g^{-1}) + \sigma(g).$$

Since $\sigma(1) = 0$ we obtain that $\sigma \in \text{ZS}^1(G, A)$.

One can also see from Definition 1.5 that $\text{CS}^0(G, A) = A$; hence the definition of ∂^0 assure us that $\text{Pder}(G, A) = \text{BS}^1(G, A)$. \square

It is known that if we use normalized cochains the group cohomology is the same. We will show that by using normalized cochains the conditions on a symmetric cocycle and on a symmetric boundary are much easier to handle. Let $n \geq 0$ be an integer. Recall that $H^n(G, A) = \text{Z}^n(G, A) / \text{B}^n(G, A)$, where $\sigma \in \text{Z}^n(G, A)$ is a normalized cocycle if $\partial_G^n(\sigma) = 0$ and

$$\sigma(g_1, \dots, g_n) = 0$$

for any $g_1, \dots, g_n \in G$ with some $g_i = 1$ where $i \in \{1, \dots, n\}$. Similarly we have the definition of a normalized boundary. We say that a n -cochain $\sigma : G^n \rightarrow A$ satisfies the $(*)$ conditions if

$$\sigma(g_1, g_1^{-1}, g_3, \dots, g_n) = 0$$

$$\sigma(g_1, \dots, g_{i-1}, g_i, g_i^{-1}, g_{i+2}, \dots, g_n) = 0 \quad \text{for } 1 < i < n$$

$$\sigma(g_1, \dots, g_{n-2}, g_n, g_n^{-1}) = 0$$

for any $g_1, \dots, g_n \in G$. Also, we say that a n -boundary $\sigma : G^n \rightarrow A$ is a n - $(*)$ -boundary if there is $\beta : G^{n-1} \rightarrow A$ which satisfies the corresponding $(*)$ conditions such that $\partial^n(\beta) = \sigma$. For the rest of this section we will work with normalized n -cochains in the case of usual group cohomology. For p an integer we denote by ${}_pA$ the subgroup $\{a \in A \mid pa = 0\}$, which is the p -torsion subgroup of A .

Proposition 2.2. *Let A be a G -module such that ${}_2A = 0$. Then:*

(a) *$\text{ZS}^n(G, A)$ is the abelian group of all normalized n -cocycles which satisfies $(*)$.*

(b) $BS^n(G, A)$ is the abelian group of all normalized n -(*)-boundaries which satisfies (*).

Proof. a) Let $\sigma \in ZS^n(G, A)$. Then for any $y_1, \dots, y_{n+1} \in G$ we have

$$y_1 \sigma(y_2, \dots, y_{n+1}) + \sum_{j=1}^n (-1)^j \sigma(y_1, \dots, y_j y_{j+1}, \dots, y_{n+1}) + (-1)^{n+1} \sigma(y_1, \dots, y_n) = 0 \quad (1)$$

and

$$\sigma(g_1, \dots, g_n) = -g_1 \sigma(g_1^{-1}, g_1 g_2, g_3, \dots, g_n) \quad (2)$$

$$\sigma(g_1, \dots, g_n) = -\sigma(g_1, \dots, g_{i-1} g_i, g_i^{-1}, g_i g_{i+1}, \dots, g_n) \quad \text{for } 1 < i < n \quad (3)$$

$$\sigma(g_1, \dots, g_n) = -\sigma(g_1, g_2, \dots, g_{n-1} g_n, g_n^{-1}) \quad (4)$$

for any $g_1, \dots, g_n \in G$.

We take $g_n = 1$ in (4) to get $\sigma(g_1, \dots, g_{n-1}, 1) = -\sigma(g_1, \dots, g_{n-1}, 1)$ and since $2A = 0$ we obtain $\sigma(g_1, \dots, g_{n-1}, 1) = 0$. Let $g_1 = 1$ in (2) and $g_i = 1, 1 < i < n$, in (3) to obtain similarly that σ is normalized. We take $g_2 = g_1^{-1}$ in (2) to obtain the first condition of (*); we use that σ is normalized. In the same way we take $g_{i+1} = g_i^{-1}, 1 < i < n$, in (3) and $g_{n-1} = 1$ in (4) to obtain the remaining conditions of (*).

For the reverse inclusion let $\sigma \in Z^n(G, A)$ such that (*) is true. It follows that σ is normalized and satisfies (1). In (1) we take

$$y_1 = g_1, y_2 = g_1^{-1}, y_3 = g_1 g_2, y_4 = g_3, \dots, y_{n+1} = g_n$$

to obtain (2). By taking in (1)

$$y_1 = g_1, \dots, y_{n-1} = g_{n-1} g_n, y_n = g_n^{-1}, y_{n+1} = g_n$$

we obtain (4). Next, we fix i such that $1 < i < n$ and let

$$y_1 = g_1, \dots, y_i = g_i, y_{i+1} = g_i^{-1}, y_{i+2} = g_i g_{i+1}, y_{i+3} = g_{i+2}, \dots, y_{n+1} = g_n.$$

It follows that in the sum from (1) for $j = i - 1$ we obtain

$$(-1)^{i-1} \sigma(g_1, \dots, g_{i-1} g_i, g_i^{-1}, g_i g_{i+1}, \dots, g_n),$$

for $j = i + 1$ we obtain

$$(-1)^{i+1} \sigma(g_1, \dots, g_n)$$

and all the other terms are zero, since σ is normalized and satisfies (*); hence (3) is true.

b) Let $\sigma \in BS^n(G, A)$. Then there is $\beta : G^{n-1} \rightarrow A$ such that for any $y_1, \dots, y_n \in G$ we have

$$\sigma(y_1, \dots, y_n) = y_1 \beta(y_2, \dots, y_n) + \sum_{j=1}^{n-1} (-1)^j \beta(y_1, \dots, y_j y_{j+1}, \dots, y_n) + (-1)^n \beta(y_1, \dots, y_{n-1}) \quad (5)$$

and

$$\beta(g_1, \dots, g_{n-1}) = -g_1 \beta(g_1^{-1}, g_1 g_2, g_3, \dots, g_{n-1}) \quad (6)$$

$$\beta(g_1, \dots, g_{n-1}) = -\beta(g_1, \dots, g_{i-1} g_i, g_i^{-1}, g_i g_{i+1}, \dots, g_{n-1}) \quad \text{for } 1 < i < n-1 \quad (7)$$

$$\beta(g_1, \dots, g_{n-1}) = -\beta(g_1, g_2, \dots, g_{n-2} g_{n-1}, g_{n-1}^{-1}) \quad (8)$$

for any $g_1, \dots, g_{n-1} \in G$. We take $g_1 = 1$ in (6), $g_i = 1$ in (7) and $g_{n-1} = 1$ in (8) to obtain that β is normalized. Since β is normalized and satisfies (6), (7), (8) the same proof as in the first part of a) assure us that σ is a n -(*)-boundary. Since $BS^n(G, A) \subseteq ZS^n(G, A)$ we know from a) that σ satisfies (*).

For the reverse inclusion let $\sigma \in B^n(G, A)$ be a n -(*)-boundary which satisfies (*). So there is $\beta : G^{n-1} \rightarrow A$ normalized such that (5) is true. In (5) we consider

$$y_1 = g_1, y_2 = g_1^{-1}, y_3 = g_1 g_2, y_4 = g_3, \dots, y_n = g_{n-1}$$

to obtain (6). To obtain (8) we take

$$y_1 = g_1, y_2 = g_2, \dots, y_{n-2} = g_{n-2} g_{n-1}, y_{n-1} = g_{n-1}^{-1}, y_n = g_{n-1}$$

in (5). For the last condition fix i such that $1 < i < n-1$ and let

$$y_1 = g_1, \dots, y_{i-1} = g_{i-1} g_i, y_i = g_i^{-1}, y_{i+1} = g_i, \dots, y_n = g_{n-1}.$$

Now, in the sum from (5) for $j = i-1$ we obtain

$$(-1)^{-1} \beta(g_1, \dots, g_{n-1}),$$

for $j = i+1$ we obtain

$$(-1)^{i+1} \beta(g_1, \dots, g_{i-1} g_i, g_i^{-1}, g_i g_{i+1}, \dots, g_{n-1})$$

and all the other terms are zero; hence (7) is true. □

For $n = 2$ we have the next corollary which shows us that using normalized cochains the conditions to define symmetric cocycles and coboundaries appears to be more easy to remember and to work with them.

Corollary 2.3. *Let A be a G -module such that ${}_2A = 0$. Then:*

- (a) $ZS^2(G, A) = Z^2(G, A) \cap \{\sigma : G \times G \rightarrow A \mid \sigma(g, g^{-1}) = 0, \forall g \in G\};$
- (b) $BS^2(G, A) = B^2(G, A) \cap \{\sigma : G \times G \rightarrow A \mid \sigma(g, g^{-1}) = 0, \forall g \in G\}.$

3. Symmetric cohomology and Mackey functors

In [1, Corollary 4.2] Singh proves that there is a well-defined restriction and inflation map for continuous symmetric cohomology. Using explicit descriptions we will define a restriction, conjugation and transfer map in algebraic context, for symmetric cohomology. Moreover we will investigate when these maps give a Mackey functor; see [5, §53]. If $\sigma \in CS^n(G, A) \cap \text{Ker} \partial^n$ is a *symmetric cocycle* we denote by $[\sigma]_S \in HS^n(G, A)$ its cohomology class.

3.1. Let $K \leq H \leq G$ and $n \geq 0$ an integer. It is easy to show that

$$r_H^G : HS^n(G, A) \rightarrow HS^n(H, A); \quad r_H^G([\sigma]_S) = [\text{res}_H^G(\sigma)]_S$$

is a well-defined linear map and satisfies $r_K^H \circ r_H^G = r_K^G$.

Lemma 3.1. *Let H be a subgroup of G , $g \in G$, A be a G -module and $n \geq 0$ be an integer.*

- (1) *If $\sigma \in CS^n(H, A)$ then $c_{g,H}(\sigma) \in CS^n({}^gH, A)$ and $\text{tr}_H^G(\sigma) \in CS^n(G, A)$.*
- (2) *The following two diagrams are commutative*

$$\begin{array}{ccc} CS^n(H, A) & \xrightarrow{c_{g,H}} & CS^n({}^gH, A) \\ \downarrow \partial_H^n & & \downarrow \partial_{{}^gH}^n \\ CS^{n+1}(H, A) & \xrightarrow{c_{g,H}} & CS^{n+1}({}^gH, A) \end{array} \quad ,$$

$$\begin{array}{ccc} CS^n(H, A) & \xrightarrow{\text{tr}_H^G} & CS^n(G, A) \\ \downarrow \partial_H^n & & \downarrow \partial_G^n \\ CS^{n+1}(H, A) & \xrightarrow{\text{tr}_H^G} & CS^{n+1}(G, A) \end{array} \quad .$$

Proof. (1) We will show the statement for tr_H^G ; the similar statement for $c_{g,H}$ is left to the reader. Let $g_1, \dots, g_n \in H$. We have

$$\begin{aligned}
& ((1, 2)\text{tr}_H^G(\sigma))(g_1, \dots, g_n) \\
&= -g_1 \text{tr}_H^G(\sigma)(g_1^{-1}, g_1 g_2, g_3, \dots, g_n) \\
&= -g_1 \sum_{c \in G/H} \overline{x_2 c} \sigma(\overline{x_2 c}^{-1} g_1^{-1} \overline{x_1 c}, \overline{x_1 c}^{-1} g_1 g_2 \overline{x_3 c}, \overline{x_3 c}^{-1} g_3 \overline{x_4 c}, \dots, \overline{x_n c}^{-1} g_n \overline{c}) \\
&= \sum_{c \in G/H} -\overline{x_1 c} \overline{x_1 c}^{-1} g_1 \overline{x_2 c} \sigma((\overline{x_1 c}^{-1} g_1 \overline{x_2 c})^{-1}, \overline{x_1 c}^{-1} g_1 \overline{x_2 c} \overline{x_2 c}^{-1} g_2 \overline{x_3 c}, \dots, \overline{x_n c}^{-1} g_n \overline{c}) \\
&= \sum_{c \in G/H} \overline{x_1 c} ((1, 2)\sigma)(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \overline{x_2 c}^{-1} g_2 \overline{x_3 c}, \dots, \overline{x_n c}^{-1} g_n \overline{c}) \\
&= \text{tr}_H^G(\sigma)(g_1, \dots, g_n),
\end{aligned}$$

where the last equality is true since $\sigma \in CS^n(H, A)$.

Let i be an integer such that $1 < i < n$.

$$\begin{aligned}
& ((i, i+1)\text{tr}_H^G(\sigma))(g_1, \dots, g_n) \\
&= -\text{tr}_H^G(\sigma)(g_1, \dots, g_{i-1} g_i, g_i^{-1}, g_i g_{i+1}, \dots, g_n) \\
&= -\sum_{c \in G/H} \overline{x_1 c} \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \dots, \overline{x_{i-1} c}^{-1} g_{i-1} g_i \overline{x_{i+1} c}, \\
&\quad \overline{x_{i+1} c}^{-1} g_i^{-1} \overline{x_i c}, \overline{x_i c}^{-1} g_i g_{i+1} \overline{x_{i+2} c}, \dots, \overline{x_n c}^{-1} g_n \overline{c}) \\
&= \sum_{c \in G/H} \overline{x_1 c} ((i, i+1)\sigma)(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \overline{x_2 c}^{-1} g_2 \overline{x_3 c}, \dots, \overline{x_n c}^{-1} g_n \overline{c}) \\
&= \text{tr}_H^G(\sigma)(g_1, \dots, g_n),
\end{aligned}$$

where the last equality is true since $\sigma \in CS^n(H, A)$. Finally for the action of $(n, n+1)$ we obtain

$$\begin{aligned}
& ((n, n+1)\text{tr}_H^G(\sigma))(g_1, \dots, g_n) \\
&= -\text{tr}_H^G(\sigma)(g_1, \dots, g_{n-1} g_n, g_n^{-1}) \\
&= -\sum_{c \in G/H} \overline{x_1 g_n^{-1} c} \sigma(\overline{x_1 g_n^{-1} c}^{-1} g_1 \overline{x_2 g_n^{-1} c}, \dots, \overline{x_{n-1} g_n^{-1} c}^{-1} g_{n-1} g_n \overline{x_n^{-1} c}, \overline{x_n^{-1} c}^{-1} g_n^{-1} \overline{c})
\end{aligned}$$

If c runs in G/H then $g_n^{-1} c$ runs in G/H hence we can replace $g_n^{-1} c$ by c and we

continue the above equalities:

$$\begin{aligned}
& ((n, n+1) \text{tr}_H^G(\sigma))(g_1, \dots, g_n) \\
&= - \sum_{c \in G/H} \overline{x_1 c} \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \dots, \overline{x_{n-1} c}^{-1} g_{n-1} g_n \overline{c}, \overline{c}^{-1} g_n^{-1} \overline{g_n c}) \\
&= - \sum_{c \in G/H} \overline{x_1 c} \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \dots, \overline{x_{n-1} c}^{-1} g_{n-1} \overline{g_n c} \overline{g_n c}^{-1} g_n \overline{c}, (\overline{g_n c}^{-1} g_n \overline{c})^{-1}) \\
&= \sum_{c \in G/H} \overline{x_1 c} (n, n+1) \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \dots, \overline{x_{n-1} c}^{-1} g_{n-1} \overline{x_n c}, \overline{x_n c}^{-1} g_n \overline{c}) \\
&= \sum_{c \in G/H} \overline{x_1 c} \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \dots, \overline{x_{n-1} c}^{-1} g_{n-1} \overline{x_n c}, \overline{x_n c}^{-1} g_n \overline{c}) \\
&= \text{tr}_H^G(\sigma)(g_1, \dots, g_n),
\end{aligned}$$

where the fourth equality is true since $\sigma \in CS^n(H, A)$.

- (2) The proof of that statement (2) follows from the similar result for the usual group cohomology and statement (1). □

Now Lemma 3.1 assure us that there are well-defined linear maps, conjugation and transfer, which we consider in the next definition.

Definition 3.2. The *conjugation map* for symmetric cohomology is

$$c_{g,H} : \text{HS}^n(H, A) \rightarrow \text{HS}^n({}^g H, A), \quad c_{g,H}([\sigma]_S) = [c_{g,H}(\sigma)]_S,$$

and the *transfer map* is

$$t_H^G : \text{HS}^n(H, A) \rightarrow \text{HS}^n(G, A), \quad t_H^G([\sigma]_S) = [\text{tr}_H^G(\sigma)]_S,$$

where $\sigma \in CS^n(H, A)$ is a symmetric cocycle.

Remark 3.3. It might be possible that $c_{g,H}$ and t_H^G to be defined as consequences of [1, Proposition 4.1] but we prefer these explicit constructions.

It is well known that there is a natural map from the symmetric group cohomology to the usual group cohomology

$$i : \text{HS}^n(G, A) \rightarrow H^n(G, A), \quad i([\sigma]_S) = [\sigma].$$

Theorem 3.2. *Let $n \geq 0$ be an integer, let K, H be subgroups of G with $K \leq H$ and $g \in G$. If the natural map i is one to one then the family of abelian groups $\{\text{HS}^n(H, A)\}_{H \leq G}$ together with the linear maps $\{r_K^H, t_K^H, c_{g,H}\}_{K \leq H, g \in G}$ is a Mackey functor.*

Proof. We recall the well-known axioms of a Mackey functor [5, §53] which we want to prove

- (i) $r_L^K r_K^H = r_L^H$; $t_K^H t_L^K = t_L^H$ if $L \leq K \leq H$;
- (ii) $r_H^H = t_H^H = \text{id}_{\text{HS}^n(H, A)}$;
- (iii) $c_{gh, H} = c_{g, {}^h H} c_{h, H}$ if $g, h \in G$;
- (iv) $c_{h, H} = \text{id}_{\text{HS}^n(H, A)}$ if $h \in H$;
- (v) $c_{g, K} r_K^H = r_{gK}^H c_{g, H}$, $c_{g, H} t_K^H = t_{gK}^H c_{g, K}$ if $K \leq H$ and $g \in G$;
- (vi) Mackey axiom: if $L, K \leq H$ then

$$r_L^H t_K^H = \sum_{h \in [L \backslash H / K]} t_{L \cap {}^h K}^L r_{L \cap {}^h K}^{{}^h K} c_{h, K}.$$

The first part of statement (i), statements (ii), (iii) and (v) are easy to verify since the equalities hold for maps of cochain complex in general, the hypothesis that i is injective. We exemplify with (v). Let $\sigma \in \text{CS}^n(H, A)$ and $g_1, \dots, g_n \in K$ and $g \in G$. We have

$$c_{g, K}(\text{res}_K^H(\sigma))(g_1, \dots, g_n) = \text{gres}_K^H(g_1, \dots, g_n) = g\sigma(g_1, \dots, g_n);$$

$$\text{res}_K^{gH}(c_{g, H}(\sigma))(g_1, \dots, g_n) = c_{g, K}(\sigma)(g_1, \dots, g_n) = g\sigma(g_1, \dots, g_n).$$

For the second part let $\sigma \in \text{CS}^n(K, A)$ and $g_1, \dots, g_n \in {}^g H$. By abuse of notation we use the same notations for t_K^H as in 1.3.

$$\begin{aligned} c_{g, H}(\text{tr}_K^H(\sigma))(g_1, \dots, g_n) \\ &= g\text{tr}_K^H(g_1, \dots, g_n) \\ &= g \sum_{c \in H/K} \overline{x_1 c} \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \overline{x_2 c}^{-1} g_2 \overline{x_3 c}, \dots, \overline{x_n c}^{-1} g_n \overline{c}) \end{aligned}$$

It is clear that if $H = \bigcup_{c \in H/K} c$ then ${}^g H = \bigcup_{c \in {}^g H/{}^g K} {}^g c$ and $\overline{{}^g c} = {}^g \overline{c}$ for any $c \in H/K$. Hence we have

$$\begin{aligned}
& \text{tr}_{{}^g K}({}^g c_{g,K}(\sigma))({}^g g_1, \dots, {}^g g_n) \\
&= \sum_{c \in {}^g H/{}^g K} \overline{{}^g x_1 {}^g c} \, c_{g,K}(\sigma) (\overline{{}^g x_1 {}^g c}^{-1} {}^g g_1 \overline{{}^g x_2 {}^g c}, \dots, \overline{{}^g x_n {}^g c}^{-1} {}^g g_n \overline{{}^g c}) \\
&= \sum_{c \in {}^g H/{}^g K} g \overline{x_1 c} g^{-1} g \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \dots, \overline{x_n c}^{-1} g_n \overline{c}) \\
&= g \sum_{c \in H/K} \overline{x_1 c} \sigma(\overline{x_1 c}^{-1} g_1 \overline{x_2 c}, \dots, \overline{x_n c}^{-1} g_n \overline{c})
\end{aligned}$$

For (iv) we need to prove that $[c_{h,H}(\sigma)]_S = [\sigma]_S$ if $h \in H$ and σ is a symmetric cocycle. Since for the usual group cohomology we have that $[c_{h,H}(\sigma)] = [\sigma]$, using the injectivity and the definition of i we are done. With some technical adjustments similar arguments work for (vi) and the second part of (i), again using the injectivity of the map i . \square

By [3, Proposition 4.1] and Theorem 3.2 we have the next corollary.

Corollary 3.3. *Let $n \geq 0$ be an integer, let K, H be subgroups of G with $K \leq H$ and $g \in G$. Let A be a G -module such that $n+1$ is not a zero divisor and the equation $n!x = a$ has a unique solution. Then the family of abelian groups $\{\text{HS}^n(H, A)\}_{H \leq G}$ together with the linear maps $\{r_K^H, t_K^H, c_{g,H}\}_{K \leq H, g \in G}$ is a Mackey functor.*

Remark 3.4. We observe from the proof of Theorem 3.2 that some axioms of the definition of the Mackey functor for symmetric cohomology are proved in general without the assumption that i is injective. It is an open problem if all the axioms can be proved in general, without this assumption.
